

# Frontend Mentor Exercise: Stats Preview Card

## Description

A basic exercise to start thinking through the basic challenges of project setup, layout design, and stylesheet development. Build a responsive component that shows a header, paragraph, a series of statistics, and a stock image.

## Requirements

Over the course of this project you will develop a working HTML/CSS prototype that matches the mockup provided.

- Clone the provided repository (see below), create a branch to work in, and publish that branch to AzureDevOps (AZD) for group review.
- Implement responsive functionality that matches the desktop and mobile mockups provided in the Frontend Mentor exercise.
- Follow the design recommendations found inside the `style-guide.md` file in the repository
- Implement the favicon to appear in the browser tab
- Implement the two Google fonts specified in the style guide
- Match the provided image asset to the purple image seen in the mockup

## Stretch Goals

- Implement the responsive design without the use of media queries
- Implement functionality that reverts the image to black & white on mouseover/hover
- Implement the colors using css variables

## Review Process

At the end of the exercise we will perform a group code review. Be ready to explain any problems you encountered, how you overcame them, and why you chose to implement your prototype in the way that you did.
